Introduction to our native landscape

What is a native plant?

Native plants are plants that are indigenous to a particular area or region. In North America we are referring to the flora that existed in an area or region before European settlement. Native plants occur within specific plant communities that vary in species composition depending on the habitat in which they are found. A few examples of habitats are tidal wetlands, woodlands, meadows and dunelands. Each of these habitats supports plants and animals that have evolved together forming a community of inter-dependence. In nature there are no dividing lines, so habitats overlap and change gradually as do the animal and plant communities living within them.

What is an alien Plant?

Aliens or exotics, are plants that have been introduced to a region or area where they did not naturally occur. This process occurs in nature, however it happens at a much slower rate and only occurs by wind, tide or animal driven methods. Through human intervention, thousands and thousands of plants have made their way into new habitats in the past several hundred years. Many were purposely brought over for medicinal purposes, ornamental use, or for food production. However many plant seeds hitched a ride to new habitats hidden in soil, animal digestive tracts, crop seed, or ballast and were not intentionally introduced. Many of these introduced plants are fairly benign and do not seriously impact our natural environment. In fact, the large majority of our garden specimens that we take for granted are aliens, either from distant parts of the US, ie: Blue Spruce (*Picea pungens*) or from other continents ie: Japanese Azalea (*Rhododendron japonicum*).

The majority of introduced and alien plants do not escape into the wild and do not become problematic.

What is an invasive plant?

An invasive plant is an alien species that has spread out of control.

A percentage of alien species not only thrive, but aggressively spread and out-compete native species on a scale that seriously reduces the diversity of native plant and animal communities and upsets the balance of ecosystems. The invasive species sometimes becomes so successful that it ends up dominating a plant community that was once comprised of many species, changing it into a monoculture of a single species or just a few species, ie: Common reed (*Phragmites*).

Exotics that become invasive usually have qualities giving them a competitive edge over the native species. An exotic plant introduced to a “new” habitat may not be exposed to the same competitive pressures as it would have encountered in the habitat in which it evolved. These competitive pressures include, but are not limited to; predation by insects, birds, or mammals, disease, limited natural resources such as nutrients or water, and harsh temperature fluctuations. When these controls are not present on the invasive species, it often allows the plant to far outcompete any native contender.

What is a weed?

A weed is a subjective term referring to any plant that grows in an undesirable area. For example, many of us highly value the presence of bluestem grass in our lawn but regard it as a weed when it is found in our vegetable garden competing for space nutrients and water. A weed is not necessarily an exotic/alien although many weeds are. Bull thistle (*Cirsium vulgare*), garlic mustard (*Alliaria petiolata*) and the common dandelion (*Taraxacum officinale*) are examples of these exotic/invasive weeds.

Poison Ivy (*Toxicodendron radicans*) is an example of a native plant that many people find extremely undesirable in the garden. However it is an important component of native plant communities, providing food and shelter for wildlife.

Noxious Weeds

Noxious weeds have the most undesirable characteristics of all weeds. An invasive plant is also referred to as a noxious weed. Each of our states has its own set of laws and regulations for “Noxious Weeds”. Noxious weeds can have great economic impact on agriculture. They may reduce crop yields by competing for space and nutrients. They may be poisonous to animals and humans. They can help to spread insect pests and crop diseases.

Noxious weeds are very difficult to eradicate. They are survivors and fierce competitors. Most are prolific seed producers and many of those seeds are viable for years. They may complete several life cycles in one growing season and some may reproduce asexually, spreading by means of rhizomes and stolons. Some even release chemicals that prevent growth of other plants.

What is a Naturalized Plant?

A naturalized plant is an introduced alien species that has become comfortably established and has found a niche for itself amongst the native plant communities without pushing out native competitors. Examples of naturalized plants are Beach Rose (*Rosa rugosa*), Queen Anne’s Lace (*Daucus carota*), and Chicory (*Cichorium intybus*). Despite the fact they are widespread, they don’t dominate to the point of exclusion of everything else.

What is a disturbed habitat?

We generally refer to a disturbed habitat as meaning a habitat that has been changed because of human intervention or through natural disturbances. Following any disturbances to habitats, whether human-caused or natural, plant communities undergo a process to re-colonize. This is termed **succession** and has been broken down into two stages. **Primary succession** occurs in areas cleared of all biological influence including the careful ecology found in soil. Most areas that will undergo primary succession are devoid of all soil that may or may not have previously been there. This may occur through natural means such as volcanoes, earthquakes, movement of glaciers, very severe wildfires or when new land has been left by the tides. Primary succession may also occur through human means such as the laying down and subsequent abandonment of concrete or rock, mining, detonating bombs – atomic or otherwise, or processes such as bulk heading. The plants involved in this process actually create soil by breaking down rock and the slow cycle of life and death. These plants may also deposit nutrients such as nitrogen or change the pH of the soil to something more amenable to future life. These plants are called **pioneer species**. As the pioneer species create new habitat **secondary succession** occurs. This process is simply a succession of plants and animal communities that occur on damaged, but previously inhabited land. Secondary succession does not have to happen directly after primary succession and frequently occurs without it. Similar to primary succession, secondary succession may occur through human or natural methods however the scale of disturbance is much less. Events that may prompt secondary succession include; land clearing, either by logging or land slide, fire, flooding, insect infestation, disease and many others. When an area eventually reaches a steady state where the composition of plant species no longer changes, it is referred to as a **climax community**. These same species will persist in roughly the same numbers assuming an outside factor does not affect the ecosystem. This is the end result of secondary succession.

Unfortunately when a habitat has been disturbed on a small scale, as often happens when land is cleared by humans, this opens the door for rapidly growing invasive species to step in. Often without further human intervention this land will become impregnable to native plants as the invasive species block entry to their newly conquered land.

What we should know about invasive plants

Thirty-five percent of plant species found in New York State are non-native plant species. New York and Florida have the highest percentage of non-native species of the continental United States. <http://tncinvasives.ucdavis.edu/products/wma/li-summary.pdf>. It has been over 300 years since New York City and Long Island were settled by Europeans and in that time thousands of non-native species have been introduced. Many of the non-natives came through the Port of New York. As a consequence non-native plants can be found almost everywhere and they pose a real threat to biodiversity.

Long Island has approximately 50,000 acres of pine barrens, native grassland, savanna, and shrubland ecosystems. Taken as a group they are threatened both regionally and nationally. Long Island is home to more than 3,500 acres of good quality coastal oak forests. It has more than 4,300 acres of freshwater wetlands and thousands of acres of coastal beaches, dunes and tidal wetlands. <http://tncinvasives.ucdavis.edu/products/wma/li-summary.pdf> Many of these ecosystems are threatened by invasive plant species. Two major causes in the deterioration of ecosystems are outright habitat destruction and invasive species.

Therefore, it is critical for us individually to do our part to promote native species and to control non-native species.

Examples of invasive plants found in specific habitats in East Hampton

Tidal Marshes: The most threatening invasive in our tidal marshes is the Common Reed (*Phragmites australis*). Phragmites is a very aggressive, rapidly spreading species, and is succeeding in out competing native marsh vegetation. It is the worst kind of invasive species. It creates a near monoculture which severely reduces biodiversity within the tidal marsh. Examples of this hostile takeover can be seen at Hook Pond, Soak Hides, Fresh Pond, Alewife Pond, Georgica Pond, Accabonac Harbor, Pussy's Pond, Big Reed Pond and Lake Montauk. Phragmites is most happy in fresh and brackish water as well as roadside ditches. However, it has gained such a foothold in our community it can be seen growing most places there is access to a steady fresh water supply.

Woodlands: It is more difficult to name one particular invasive plant that is adversely affecting our woodlands. Many times the degradation of a woodland habitat begins along roadsides that border or intersect the ecosystem and trails that traverse the woodlands. These are the places where seeds are more easily dispersed by foot (animal and human) and/or vehicle. Oriental Bittersweet (*Celastrus orbiculata*), Black Locust (*Robinia pseudoacacia*), Norway Maple (*Acer plantanoides*), Japanese Honeysuckle (*Lonicera japonica*), Tartarian Honeysuckle (*Lonicera tatarica*), Multiflora Rose (*Rosa multiflora*), and Garlic Mustard (*Alliaria petiolata*) are the most common invaders of woodlands.

A good place to observe infestation of invasives in a woodland environment is at the Buckskill Nature Preserve along the roadside of Stephen Hands Path near Route 114 (Sag Harbor Turnpike). Invasives have not established in the woodland interior, but a wide variety of invasives are well established in wide swathe along the roadside. Pussy's Pond Nature Preserve woodland is also a good place to observe the above-referenced invasive plants.

Downs/Grasslands: In grasslands plants are exposed to full sun and near constant wind. These adverse conditions tend to deter invaders, however they do exist. As recently as the 1920's a good portion of Montauk was still grasslands, but habitat degradation has occurred. New York State Parks have been working with The Nature Conservancy to preserve existing grasslands and restore degraded areas to native grasslands at Theodore Roosevelt Park in Montauk. This is a good place to visit to see intact grasslands as well as areas that are in the process of being restored. One can also see a variety of invasives such as Japanese Honeysuckle (*Lonicera japonica*), Tartarian Honeysuckle (*Lonicera tatarica*), Oriental Bittersweet (*Celastrus orbiculata*), Autumn Olive (*Elaeagnus umbellata*), and Multiflora Rose (*Rosa multiflora*) that are being fought.

Montauk Moorlands: This habitat is unique to Montauk. It can be described as a dwarf forest that has gradually replaced what was once downs/grassland vegetation. Troublesome invasives to the moorlands include Japanese Honeysuckle (*Lonicera japonica*). Tartarian Honeysuckle (*Lonicera tartarica*), Oriental Bittersweet (*Celastrus orbiculata*), Autumn Olive (*Elaeagnus umbellate*), Multiflora Rose (*Rosa multiflora*), and Common Reed (*Phragmites australis*). One can see many of these invasives in Shadmoor State Park along the trails. Phragmites occurs in many of the wetlands within the park.

Old Fields: Old fields refer to lands that had been cleared by European settlers for farming and ranching as opposed to grasslands that were a result of natural fires or clearing/burning by Native Americans. The “old fields” include fallow fields, old orchards, pastures, and farmland. They differ from the grasslands in that when the Europeans arrived they brought with them the seeds and plants (both agricultural and ornamental) that they were familiar with in the Old Country. Inevitably this included the introduction of unintentional weeds as well. Our old fields are a mix of native plant species and exotics. Not all of the alien plants introduced were invasive, some we refer to as naturalized (see page 2; What is naturalized?). Even though these naturalized species do not out compete natives, it would be preferable for these fields to be reverted to a completely native population. An example of an old field can be observed in a Nature Preserve (SCTM No. 300-118-1-12.67) located between 400 Hands Creek Rd. and 440 Hands Creek Rd..

Two East Hampton Town (EHT) owned lands, EHT Springs Park and EHT Bull Path landfill, are examples of how disturbed areas that have been cleared may become dominated by invasive species. The old Bull Path landfill (SCTM Nos. 300-135-2-15.2 & 34.2) has been taken over by a plethora of invasives including Mugwort (*Artemesia vulgaris*), Autumn Olive (*Elaeagnus umbellate*), Black Locust (*Robbinia pseudoacacia*), and Tree of Heaven (*Alianthus altissima*). EHT Springs Park 396 Three Mile Harbor Hog Creek Hwy. (SCTM No. 300-61-4-4.2) was a commercial nursery at one time, but when the Town of East Hampton acquired it the park was a greatly disturbed site. It is a good place to observe Mugwort and Autumn Olives though some native plants typical to old fields and grasslands such as Switchgrass (*Panicum virgatum*), Partridge Pea (*Cassia fasciculata*), and Maryland Golden Aster (*Chrysopsis mariana*) remain, struggling to compete with the invasives.

Duneland: Plants that can grow in dunelands must be able to tolerate full sun, exposure to wind, drought, and nutrient poor soil/sand. Invasives that meet these criteria are Japanese Knotweed (*Polygonum cuspidatum*), Japanese Black Pine (*Pinus thunbergiana*), Russian Olive (*Eleangus angustifolium*), Autumn Olive (*Eleangus umbellata*) and Spotted Knapweed (*Centaurea maculosa*). A place to observe Japanese Knotweed and Spotted Knapweed is at Louse Point near the boat launch. EHT has an ongoing project to eradicate the Japanese Knotweed stands on Louse Point. Gerard Drive (Accabonac Harbor) is a good place to observe Japanese Black Pine and Russian/Autumn Olives in a duneland environment. (EHTNRD has been actively removing Japanese Black Pine and Russian/Autumn Olives on the Gerard Point Nature Preserve). Atlantic Double Dunes have Japanese Black Pines that EHT and The Nature Conservancy (TNC) are trying to eradicate. Along the southside of Bluff Rd. at Atlantic Double Dunes one can observe a large, well established stand of Japanese Knotweed.

Some of the worst invasive non-natives in our area:

Despite their invasive status, there are still some local nurseries that continue to sell invasive plants

Norway Maple—*Acer plantanoides*

Autumn Olive ---*Eleagnus umbellata*

Multiflora Rose—*Multiflora rose*

Tartarian Honeysuckle—*Lonicera tarterica*

Japanese Barberry—*Berberis thunbergii*

Japanese Honeysuckle—*Lonicera japonica*
Oriental Bittersweet—*Celastrus orbiculata*
Porcelain Berry—*Ampelopsis brevipedunculata*
Bamboo—*Pseudosasa japonica*
Phragmites or Common Reed—*Phragmites australis*
Garlic Mustard—*Alliaria periolata*
Japanese Knotweed—*Polygonum cuspidatum*
Purple Loosestrife—*Lythrum salicaria*
Spotted Knapweed—*Centaurea maculosa*

Aggressive invasives we commonly call weeds—often we fight with them in our gardens:

Canada Thistle, Bull Thistle—*Cirsium arvense*, *Cirsium vulgare*
Common Nightshade—*Solanum nigrum*
Common Plantain, English Plantain—*Plantago media*, *Plantago lanceolata*
Mustards—Chinese, Black, Field—*Brassica juncea*, *Brassica nigra*, *Brassica rapa*
Chickweeds—Common, Mouse-ear—*Stellaria media*, *Stellaria vulgaratum*
Lamb's-Quarters—*Chenopodium album*
Crabgrass—*Digitaria sanguinalis*
Smooth Crabgrass—*Digitaria ischaemum*
Common Dandelion—*Taraxacum officinale*

Native plant communities

A native plant community is comprised of indigenous vegetation that has adapted to that area over thousands of years. Species often have specific habitat requirements that they need to survive and reproduce. For plants the required soil conditions, light levels, accessibility of nutrients and water often vary with species and are indicative of the plants native habitat. However a plant community is influenced by more than the surrounding conditions and local plants. Elements such as disease and predation function to keep a native species in check without being harmful. Even the species of fungi that are present affect native plant species composition through mycorrhizal associations. These associations occur when fungi associate with plant roots to greatly extend the plants root network, allowing the plant access to distant moisture and nutrients. Different fungi associate with different plant species. Plants also have specific requirements to prompt reproduction. Hours of light vs darkness can stimulate flowering in some species, while others depend on temperature. Often specific animals are involved in the flowering, fertilization and dispersal of seed. As you can see, a native plant community is a delicate and intricate system between plants, animals and fungi. When one or more factors in a community are changed, the ramifications are felt throughout the whole community.

Even though humans have broken the surrounding landscape into distinct classifications, it is important to remember that this is an artificial distinction for the sole purpose of human convenience. In nature communities overlap or fade gradually from one distinct community to another. No true boundaries exist.

Below are some East Hampton plant communities that have been inventoried by the East Hampton Natural Resources Department. The Natural Resources Department has compiled comprehensive lists of native plant species that occur in each.

Outer Dunes and Back Shore (As per Napeague, ocean, bay and harbor sides) [Tab 1]

Bay Bluffs (As per Hedges Banks, Culloden Point) Maritime oak forest [Tab 2]

Amagansett Inner Dunes (As per Whaler's Cove, Bluff Road {Napeague, Double Dunes}) Maritime beach, Maritime dune [Tab 3]

Tidal Marsh- Tidal Marsh Edge and Buffer (As per Accabonac Harbor, Northwest Creek) [Tab 4]

Montauk Mesic Forest (As per Montauk Woods) Successional hardwood forest that occurs in low areas near the seacoast. [Tab 5]

Montauk Moorlands (As per Shadmoor) Maritime heathland, Maritime shrubland, Shrub swamp [Tab 6]

North of Moraine Coastal Deciduous (Typical as per Barcelona, Springs, Hither Woods) [Tab 7]

Morainal Deciduous (as per Stony Hill, Amagansett) [Tab 8]

Pine Barrens (= Pitch Pine—Oak Association){Typical to Northern Wainscott} [Tab 9]

Montauk Grasslands/Shrub Savannah (As per Prospect Hill, Montauk) Maritime grassland [Tab 10]

Northwest Woods (Typical type as per intersection of Swamp Road and Bull Path) [Tab 11]

Old Fields (As per Belle Estate III Old Field, EH Town Airport) [Tab 12]

Freshwater Wetlands (Comprehensive native wetland plant list and the wetlands in which the plants occur) [Tab 13]

Brackish Wetlands and Buffer (As per Georgica Pond, Fresh Pond, Napeague Meadow) [Tab 14]

Points to remember when revegetating an area or planting natives as part of your landscape:

Permits: East Hampton has a strong record of environmental protection. The Town Code limits the removal of native vegetation and requires that permits be obtained for work in many areas. So before you cut, clear or dig please check with the Town Planning Department to see if a permit is required for the work you have in mind.

Patience: Whether your goal is restoration of an area or you simply want to plant native species as part of your landscape, remember; it takes time. Living organisms such as trees, shrubs, and perennial wildflowers need careful tending and time to get established and mature before they will flower and bear fruits or seeds. However even a mature habitat is vulnerable to encroachment by invasive species and other weeds, so weeding is essential. Your newly installed landscape could take years to appear as beautiful as the undisturbed mature habitat, once your plants establish themselves they will spread and flourish. Part of the fun is to watch your previously disturbed land mature into native habitat. As this happens, you may want to add or even relocate plants to maintain proper spacing. Patience and flexibility are key words to keep in mind.

Know your site

Existing plants: The area you want to restore may already have some native species. Not only do they help with the cost of revegetation, but they also tell you what plants should be there. Are these mature trees and/or shrubs? If so, they will be competing for water and nutrients with the new plants that you will be planting and it is important not to plant too closely, remember, you must allow for expansion and growth. Generally, we recommend planting 8-10' trees 10' on center and 3-4' shrubs 6' on center. Groundcovers and perennials can be planted much closer—depending on their size 1-3' on center. For more information on specific species native status, characteristics, soil preference and much more, go to the USDA Plant Database: <http://plants.usda.gov/index.html>

Sun exposure: How much sun does a particular area get during the course of the day? Some plants are adapted to full sun while others are more shade tolerant. Find out what kind of exposure each plant requires to thrive.

Soil type: Is the soil sandy, clay, loam, or peat? You can have your soil tested by Cornell University for nutrient analysis. The purpose of soil type analysis is to choose the appropriate native plants for the soil type that you have. Selecting an unsuitable plant for your soil type is only wasting your money and condemning the plant to death. Amending the soil can help, however in nutrient poor soil such as sand, adding fertilizers is often counterproductive as the fertilizers tend to leach out quickly when it rains or when you water your newly installed plants. Additionally, the nitrogen that leaches out of your soil runs into our harbors and bays causing harmful algae blooms and encouraging the growth of unwanted bacteria. To have your soil tested go to the Cornell Nutrient Analysis Laboratory for forms and instructions:

<http://cnal.cals.cornell.edu/forms/documents/CNAL-Form-H-Homegardens-External.pdf>

Soil moisture: *Xeric* - well drained soils. Soils that fall under this category are usually sand or soils containing a high concentration of rock or gravel. *Mesic* - moderate to well drained soils. These soils tend not to dry out or flood. *Hydric* - imperfectly or poorly drained soils. Soils from a hard clay lens or high water table are classified as hydric. These soils are saturated and water remains at or near the surface for long periods of time. Plants that thrive in hydric soils are commonly called wetland plants.

How well does your soil drain?

Drainage is the rate at which water percolates through a soil profile.

1. Dig a hole one foot wide and one foot deep.
2. Fill it with water and then let it drain
3. Refill the hole with water
4. Time how long it takes the water to drain

If your soil drains **less than 4 inches per hour**—your site is **poorly drained**.

If your soil drains **4-8 inches per hour**—your site is **moderately well- to well-drained**

If your soil drains **more than 8 inches per hour**—your site is **excessively drained or droughty**. Choose plants that tolerate dry or drought conditions.

Slope conditions: Is the area to be planted level or is it sloped? Steeply graded slopes are subject to erosion. You may have to anchor the plants with coco mats to secure them until their root systems get established. Look for plants that can thrive under these conditions.

Control Measures for weeds and non-natives

- Mow or cut back often (3 times per season) to sap energy from plant or vine. This will keep plant(s) at bay or from growing up and strangling your native trees and will reduce seed production.
- Cover the effected area with black plastic for one year. This will kill any living plant that is trapped underneath and deprived of light. Be aware that once you remove the plastic the seeds that remain in the soil will begin to sprout so you

will need to repeat this treatment until the seed bank that is present in the soil is exhausted. This is highly recommended for highly contaminated field areas.

- Pull seedlings and small shallow-rooted plants when soil is moist. Dig up larger plants trying to get as much of root system as possible and dispose.
- Heavy mulching (2" depth) with natural leaf litter helps to deter weeds from sprouting. In a forest community the leaf litter layer is an integral part of the forest ecosystem providing nutrients for the plants (decayed leaf litter) and habitat and cover for insects, amphibians, mammals and birds.

The need for native landscaping

With the expanding development of residential and commercial regions we have fragmented large areas of contiguous native plant communities. As new parcels of land are developed they become disturbed habitat. This occurs through the construction of man-made structures, clearing of native vegetation and in many cases can occur with the introduction of non-native plants for landscaping purposes. Good quality (pristine) native plant communities are disappearing at an alarming rate. As native plant communities disappear or are compromised by invasives/exotics, many native plant populations are becoming increasingly rare. Ecosystems are being compromised with invasive alien plant species and biodiversity is thereby threatened. Therefore, it is critical for us individually to do our part to promote native species and to control non-native species.

Alternative native plants

Following is a chart with a few examples of the kind of native plants that make good alternatives to the invasives. The comprehensive native plant lists, which are grouped by habitat, provided in this booklet may also be helpful as each species is described by its horticultural classification (tree, vine, groundcover, etc.)

Invaders	Alternatives	
Trees	Norway Maple (<i>Acer plantanoides</i>) Black Locust (<i>Robinia pseudoacacia</i>) Tree of Heaven (<i>Alianthus altissima</i>)	Oaks (Black, White, Scarlet) (<i>Quercus</i> sp) American Beech (<i>Fagus grandifolia</i>) Pitch Pine (<i>Pinus rigida</i>) White Pine (<i>Pinus strobus</i>) Flowering Dogwood (<i>Cornus Florida</i>) Eastern Redcedar (<i>Juniperus virginiana</i>)
Vines	Oriental Bittersweet Japanese Honeysuckle Porcelainberry	Virginia Creeper (<i>Parthenocissus quinquefolia</i>) Fox Grape (<i>Vitis lambrusca</i>)
Shrubs	Japanese Barberry (<i>Berberis thunbergii</i>) Autumn Olive Russian Olive Winged Euonymus or Burning Bush (<i>Euonymus alatus</i>)	Northern Bayberry (<i>Myrica pensylvanica</i>) Highbush Blueberry (<i>Vaccinium corymbosum</i>) Sweet Pepperbush (<i>Clethra alnifolia</i>) Red, Black Chokeberry (<i>Aronia arbutifolia,melanocarpa</i>)
Perennial	Purple Loosestrife (<i>Lythrum salicaria</i>) Chinese Silvergrass (<i>Miscanthus sinensis</i>) Phragmites-Common Reed	New England Blazing Star (<i>Liatris scariosa</i>) Eupatorium sp. (Joe Pyeweed, White Snakeroot, Hyssop-leaved Eupatorium) Asclezia sp. (Common Milkweed, Butterflyweed, Swamp Milkweed) Switchgrass (<i>Panicum virgatum</i>) Little Bluestem (<i>Schizachryum scoparium</i>)

Restoring native plant communities

Restoration can be thought of as an attempt to return the disturbed native plant community back to its original state through such activities as exotic species management, prescribed burns, re-seeding the disturbed area and adding transplanted native plants into the degraded community. In extreme cases, a total recreation or revegetation of the community is necessary. When no remnants of the prior community are left, we must attempt to reconstruct a native plant community at a site where it once existed. It is one of the most difficult and complex actions we can undertake. If you need to revegetate your land you should consult a professional who specializes in conservation. A list of such people can be found in the back of this book. Unfortunately restorations and recreations never really replace what originally existed because of the near impossibility of mimicking the original diversity and complexity that had developed in the area over many years. It is for this reason that we try so strongly to protect our existing native communities.

Yard plantings

The cumulative effect of many yards planted with native plants can be more effective than a single revegetated area. While individual yards cannot provide every benefit of pristine native habitat, they do go a long way toward supporting the local gene pool of wild native plants. Often native plants are also more deer resistant and require fewer resources in the form of water and fertilizer than non native alternatives. Even if you don't plan to have a yard full of native plants, the benefits of having one or two present in your landscape are enormous to our environment.

What you can do to help

Yard plantings by individuals are an invaluable source of seed to be distributed back into our local gene pool and generally put less stress on the environment in which they are found. However a lack of seed in our surroundings is not the only threat to our habitat. Aggressive invasive species are pushing out our native plants and replacing what was once a flourishing and diverse community with a monoculture, a large area that is populated by only a single species. We at the East Hampton Town Natural Resources Department are working to combat these species, however many large swaths are on private property and inaccessible to us. You can remove these plants with our blessing, however they are tenacious. If you chose to undertake this effort, be aware that it can seem overwhelming and even hopeless at times. These plants are out competing our natives because of their ability to survive under strange and adverse conditions. On your property be vigilant in removing weeds/invasives, especially before they flower and have a chance to go to seed. Remember most of these species are prolific seed producers. To remove them before they go to seed will help not only to keep the weeds down on your property (this season and next year) but will also help the surrounding area by removing those seeds and preventing the further spread to other locations. Even trimming vines such as bittersweet several times during the season will drastically cut down on the number of seeds and suckers produced.

White Tailed Deer and Ticks

White-tailed deer are more numerous today than they were prior to European settlement of North America. In pre-colonial times forests were extensive and deer were prey for wolves and mountain lions, and Native Americans hunted deer year-round for food and clothing. As these control measures were removed and new environments ideal to their survival such as suburban areas with open lawns, tasty plants in summer gardens, and an abundance of ornamental shrubs were introduced, it only exacerbated the problem. White-tailed deer are browsers and grazers –they eat the buds, twigs and leaves on a wide variety of plants. When hungry enough, deer are fairly indiscriminate in their food choice, however when food is abundant deer prefer the tasty tender shoots and buds more commonly found in non-native plants. Native plants have evolved with White-tailed deer for thousands of years and so have evolved many strategies to deter their natural predators. Non native plants, especially horticultural varieties, have none of these deterrents and so are at more risk. Deer damage to landscape plantings can occur any time of the year but the damage is usually most severe in the late winter and early spring when other food supplies are limited. This is enough of a problem on its own; however deer have been implicated as a significant vector in the transmission of Lyme disease. This occurs through the presence of the insect that incubates and spreads the disease, the tick. Tick abundance has been shown to be directly related to deer density; the more deer the more ticks. It is the Deer Tick (*Ixodes scapularis*) that transmits the bacterial Spirochete (*Borrelia burgdorferi*) that causes Lyme disease, and mammals can be infected through the bite of the tick. Ticks can be carried by mammals (deer, raccoons, opossum, etc.) and are not attracted to plants.

Planting Guide

When to plant your trees/shrubs/plants:

- The best time to transplant your plants is in the early spring when temperatures are cooler and there is usually more rainfall. Plants become dormant or die back in the winter, and a good indication of when to plant is just before bud break occurs in the surrounding environment, however plants can be planted as soon as the ground thaws. The worst time to plant/transplant is in the height of summer (June/July/August), in the middle of the plants' growing season. High temperatures and lack of water to the root system are two things that can stress the plants especially when they are not yet established. It is possible to plant in the late fall before the ground freezes, and preferably after the plant goes dormant.

How to plant your native shrub or tree:

- When you purchase your tree/shrub it will be in a plastic container or wrapped in burlap. The most important thing to remember is **never** to let the plants dry out. Make sure you water the plant well before planting.
- The hole that you dig for the plant should, initially, be both wider and deeper than the root ball of the plant. Its better for your hole to be too big than trying to shove your plant into a too small space. Don't worry about augmenting your soil, your native plant should be well adapted to whatever soil is present in your landscape. We do recommend using a small amount of top dressing with organic fertilizer just to help your plant get started. It should be well mixed with soil reserved for filling the top of the hole. However be aware, direct contact of the fertilizer with the roots may 'burn' the root hairs. We do not recommend using peat as it does not provide nutrition and is mined from wetlands.
- Place of the fill into the bottom of the hole to bring the level of the plant up to the point where the top of the root ball is even with the natural grade of the land.
- If it is a potted plant, hold it upside-down and gently shake it—it should come out. If the plant is rootbound, roots may be coming out of the drainage holes. Just cut away the roots that come out of the drainage holes. Slip or pry the plant out of the pot. Look at the roots—if they are tight and compact try to loosen the roots with your fingers. If the roots are still too tight you may have to cut them. The pot has acted as a barrier and the roots, as the plant grows larger, have no where to go and end up growing round and round the bottom of the pot. The roots need to be able to spread if the plant is to flourish. By loosening the roots or even cutting them they will be able to spread into the new soil that you are planting the tree/shrub in.
- If the plant is in burlap, you may leave the burlap but you may untie it at the top to hasten its breakdown and prevent the strangulation of your plant. Wire cages should be removed. Stay away from plants bound by plastic burlap—it will not decompose and the plant may have root rot from being in such a confined environment.
- Ease the plant gently into the hole and position it to make sure it is straight. If it has a more attractive side, now is the time to face the plant in the direction you want it to face. Start to fill in around the sides of the root ball. When you have covered the bottom third of the hole gently tamp down the soil. Continue to fill in the hole; at two thirds full tamp the soil again. Fill in the remainder of the hole and tamp down the soil. Tamping the soil helps to eliminate air pockets where water could be trapped and rot the roots. However, plants need aerated soil to grow so be sure not to compress the soil too much.

- The excess dirt should be used to form a small berm, 4-5" tall, in a circle around the perimeter of the hole that you just filled in. This berm acts as a mini dam and will help keep water around the root ball of the plant. The water will gradually soak into the area around the roots where it is needed most. In the case of small shrubs there may not be enough soil to do this, so make sure to water your new plants enough.
- Fill the bermed area gently with water. Allow the water to soak in. If the soil caves in at spots, just fill the holes and reberm your area. Fill the bermed area a second time and allow the water soak in. Repeat a third time.
- It is important not to let the plant roots dry out when the plant is trying to get established. Remember it takes some time for the roots to spread and grow. If the weather is dry and hot you will probably have to water the plant well two or three times a week. Continue the careful treatment of your plant for at least one year.
- An application of mulch around the plant will help in retaining moisture and will provide some nutrition.

Maintenance:

We do not advocate the use of herbicides to control weeds. Herbicides are chemical agents used to control or kill plants. Everything we put into our ground has the potential to make it into our aquifer, which is our **sole source** for drinking water, or to be transported into our harbors and bays via runoff. Herbicides and/or their components can be harmful pollutants to our harbors, bays, and our drinking water. So the biggest chore in maintaining your newly planted site is weed control. Mulching the site with leaf litter will prevent some weeds from emerging but some hand weeding will be necessary until your plantings get established.

Clearing your property - East Hampton Town has laws:

The Town of East Hampton has been a leader in the preservation of open space and has enacted clearing laws on properties, to protect the health of our harbors and bays, to protect our aquifer that is our sole source for our drinking water and to help preserve the rural characteristics of the town. For the homeowner there are five codes within the East Hampton Town Code that define the clearing restrictions or the conditions under which clearing may take place. They are 255-3-60 Water Recharge Overlay District, 255-3-70 Harbor Protection Overlay District, 255-4-20 Natural Resources Special Permit, 255-2-60 Residential District Provisions, and 16-4 Conservation Easements.

255-3-60 Water Recharge Overlay District

255-3-61 Purpose.

The purpose of the Water Recharge Overlay District is to provide for the application of a system of needed additional regulations for properties located in areas where disproportionately large quantities of rainwater are recharged into and stored in the underground aquifer, in order to help ensure the continued sufficiency and purity of the town's irreplaceable groundwater supply and sole source of drinking water.

255-3-65 Regulations.

In addition to any other provisions of this chapter which may apply to them, lots, lands, buildings and structures in the Water Recharge Overlay District shall be subject to the following:

A. Subdivision. No lot or land wholly or partly within the overlay district shall be subdivided (unless by subdivision waiver) except pursuant to Chapter 193 of the Code.

B. Critical area designation. Lands located within the overlay district are hereby declared to be critical areas of environmental concern pursuant to Chapter 128 of this Code.

- C. Conditional approvals. Any activity or use for which the approval of any local agency is needed may be approved by said agency conditioned upon the landowner's filing covenants and restrictions granting to the town enforceable rights against overclearing of land, landscaping, the use of fertilizers, and the manner of disposing of waste materials or any other reasonable condition or restriction necessary to ensure continued integrity of the town's groundwater.
- D. Minimized clearing. In all their actions, local agencies shall minimize, to the extent practicable, clearing and grading of natural vegetation and disturbance of the natural contours of lands within the overlay district.
- E. Limited clearing of lots. Clearing of lots or parcels of land within the Water Recharge Overlay District shall be restricted as set forth herein.

Lot Area	Maximum Clearing Permitted
----------	----------------------------

In Residence Districts:

Up to and including 39,999 sq.ft.	10,000 sq. ft. or 35% of lot area, whichever is greater
-----------------------------------	--

From 40,000 sq. ft. to and including 280,000 sq.ft.	10,000 sq. ft. + (lot area x 12.5%)
--	-------------------------------------

In Commercial districts:

All lots	10,000 sq.ft. or 50% of lot area, Whichever is greater
----------	---

Town Code 255-3-70. Harbor Protection Overlay District

The purpose of the Harbor Protection Overlay District is to maintain or improve surface water quality in East Hampton's major harbors, creeks and ponds, including Accabonac Creek, Fort Pond, Georgica Pond, Lake Montauk, Hog Creek, Napeague Harbor, Northwest Creek, Northwest Harbor, Steppingstones Pond, Three Mile Harbor, Tuthill Pond and Wainscott Pond. The district is also intended to maintain or improve wildlife habitat in these areas and to maintain or restore these waterways as closely as possible to their natural condition, so that the town's citizens and visitors can continue to enjoy and appreciate their natural values. The Harbor Protection Overlay District will help prevent the entry of stormwater runoff into the town's waters; gradually require the upgrading of out-moded or inoperable septic systems; preserve important indigenous vegetation; reduce impacts from residential and commercial swimming pools; and upgrade standards for fuel storage tanks.

255-3-75. Regulations

A. Control of stormwater runoff

- (1). no parking lot or driveway shall be constructed unless it has either an unimproved surface or an improved surface of poured concrete, hot plant mix asphalt, rapid-curing cut-back asphalt or quartz gravel.
- (2). Stormwater generated from a newly constructed driveway, road or parking lot must be directed into one ore more catchment basins.

- (3).Any road, driveway or parking lot that is constructed with an improved surface shall be maintained so that stormwater generated by said structure is directed into the catchment basin(s)
- (4).No pipe, culvert, drain may be installed which discharges stormwater into wetlands.
- (5).Every principal building or addition to the principal building shall be furnished with gutters and leaders to direct stormwater from roofs into the catchment basin(s)
- (6).During construction the disturbance of natural vegetation and land contours shall be minimized. ie. project limiting fence, siltation mesh, straw bales, etc.

B. New sanitary septic systems

- (1).must be set back a minimum of 200 ft. from surface waters
- (2).no septic system leaching pool may be installed unless bottom of the leaching pool is a minimum of four feet above the groundwater table.

C. Existing sanitary septic systems

- (1).every septic system shall be replaced or upgraded if:
 - (a).a natural resources special permit is required for work to be performed on the lot or parcel containing the septic system
 - (b).the work to be performed will increase the habitable floor area of a principal building or will increase the number of bathrooms
 - (c).the septic system does not meet the minimum requirements of the Suffolk County Department of Health

D. Limited clearing of lots.

- (1).The total area of a lot which may be cleared of indigenous natural vegetation shall not exceed the following amounts:

Lot Area	Maximum Clearing Permitted
----------	----------------------------

In Residence Districts:

Up to and including 39,999 sq.ft.	10,000 sq. ft. or 35% of lot area, whichever is greater
-----------------------------------	--

From 40,000 sq. ft. to and including 280,000 sq.ft.	10,000 sq. ft. + (lot area x 12.5%)
--	-------------------------------------

In Commercial districts:

All lots	10,000 sq.ft. or 50% of lot area, Whichever is greater
----------	---

255-2-60. Residential District Provisions

A. Limited clearing of lots. Clearing of lots or parcels of land within any residential district, except those lots located partially or wholly within the Agricultural Overlay District, Water Recharge Overlay District or the Harbor Protection Overlay District shall be restricted as set forth herein. Removal and or maintenance of dangerous dead wood and non-native invasive species is permitted. A list of non-native invasive species will be maintained by the Natural Resources Department for the purposes of this Chapter.

(1) The total area of a lot which may be clear of indigenous natural vegetation shall not exceed the following amounts for any lot located wholly or partly within a residential district:

Lot Area	Maximum Clearing Permitted
In Residence Districts:	
Up to and including 10,999 sq.ft.	100%
From 11,000 sq. ft. to and including 19,999 sq.ft.	10,999 sq. ft. or 75%, whichever is greater
From 20,000 sq. ft. to and including 280,000 sq.ft.	10,000 sq. ft. + (lot area x 25%)
Greater than 280,000 sq. ft.	80,000 sq.ft.

255-4-20 Natural resources special permit; regulations.

No person shall undertake any of the following activities or make any of the following improvements without first obtaining a natural resources special permit

A. Wetlands, waters and beaches.

- (1) Fill in or near. Place or deposit or permit to be placed or deposited debris, fill, sand gravel or any material, including structure, into or upon or within 150 feet of any boundary of any wetland, watercourse, tidal water or beach.
- (2) Clear or dredge in or near. Clear, dig, dredge, or in any other way add to, alter or remove any material, including natural products, from or within 150 feet of any wetland, watercourse, tidal water or beach.
- (3) Construct in or near. Erect, construct, reconstruct, enlarge or alter any structure including but not limited to any groin, bulkhead, dock, boathouse, residence, accessory structure, road or other improvement whatsoever, in, on or under or within 150 feet of any boundary of any wetland, watercourse, tidal water or beach.
- (4) Site new disposal systems or storage facilities in or near. Build, create or install any new cesspool, septic tank, leaching field or other in-ground sewage or other waste disposal or storage system, including any pipe, conduit or other part thereof, or any aboveground or in-ground holding tank for any liquid other than water and thereafter maintain, operate or make use of the same in, upon or under or within 200 feet of any wetland, watercourse, tidal water or beach.
- (5) Create or alter or relocate. Construct, create, eliminate, alter, relocate or enlarge or diminish in size any wetland or watercourse, whether man-made or natural, by filling, dredging, damming or any other method whatsoever. This section shall also be deemed to apply to artificial lined ponds which are greater than 1,000 square feet in size or which, regardless of size, are situate in the groundwater table.

B. Velocity floodplain.

- (1) Clear, fill or grade. Clear, dig, fill, grade or in any other way add materials to or remove materials from, any lands lying in the VE Flood Hazard Zone within the Flood Hazard Overlay District.
 - (2) Construct or install. Erect, construct, install, enlarge, alter or reconstruct any structure, including any septic system or part thereof, on or in any lands lying in the VE Flood Hazard Zone within the Flood Hazard Overlay District.
- C. Beach vegetation. Remove, uproot, bury or otherwise damage any beach vegetation, as defined herein, or replace the same with lawn, sod or turf. This section shall not be deemed to require a permit for the planting of beach vegetation not involving the disturbance of existing vegetation.
- D. Dunes. Clear, grade, cut, fill, remove or otherwise alter any dune, as defined herein.
- E. Bluffs. Perform any of the activities described in Subsection (1) through (4) of this section within 100 feet of the bluff line, as defined herein, or within 150 feet of the bluff line on lands fronting the Atlantic Ocean and lying east of the eastern boundary of Map No. 174, Montauk.

Conservation Easements

16.1 Purpose.

It is the purpose of this chapter to provide for the acquisition of, and in appropriate cases the modification or termination of, conservation easements by the Town of East Hampton over real property situate in the town for the conservation, preservation and protection of the environmental resources and the natural and man-made attributes and values of such lands. Such areas are significant because of their scenic or natural beauty, geological or ecological character or historical, archaeological or cultural amenities, and the conservation preservation and protection of these characteristics is fundamental to the maintenance and enhancement of recreational and commercial opportunities, tourism, community attractiveness, balanced growth and the quality of life in the town generally.

16-4 Minimum form and content of easements.

A.

(5) In all other cases, the grantor must agree that the land under the easement will not be developed, built upon, cleared or otherwise disturbed or changed during the term of the conservation easement, except that bona fide conservation management measures may be permitted pursuant to a conservation plan approved by the Director of Environmental Protection of the Town.

16-6 Violations

It shall be unlawful for any person, firm or corporation to violate the terms of any conservation easement granted to the Town of East Hampton

Definitions:

Beach Vegetation-Beach grass (*Ammophila breviligulata*) as well as the following plants or lichens: beach heather (*Hudsonia tomentosa*) beach plum(*Prunus maritime*), beach pea (*Lathyrus maritime*), bearberry(*Arctostaphylos uva-ursi*), bayberry (*Myrica pensylvanica*), dusty miller (*Artemisia stelleriana*),seaside goldenrod (*Solidago sempervirens*), pinebarren sandwort(*Arenaria caroliniana*), and reindeer lichen (*Cladonia species*).

Bluff—A bank or cliff with a precipitous or steeply sloped face lying landward of a beach or body of water, and having a bluffline at least two feet higher than its base or toe.

Bluff Line – The natural land contour running along the top of a bluff beyond which to landward the natural land contours resume a gradual slope.

Clearing:

- A. As applied to the act of clearing: the act of removing trees or any part thereof, brush, or other vegetation and/or groundcover from land, whether by any means, including but not limited to digging, scraping, cutting, brushhogging, bulldozing, burning, chemical removal or by any form of mechanical action. As used herein the term “groundcover” shall include naturally occurring understory vegetation (e.g. lowbush blueberry or huckleberry), as well as leaf litter and other detritus.
- B. As applied to an area of land: all land which has been altered from its natural state by the removal of trees, brush, or other vegetation and/or groundcover including land which is lawn or from which groundcover has been removed. As used herein the term “natural state” shall mean and refer to the natural condition of land without substantial alteration by human activity.

Conservation Easements- An easement, covenant, restriction or other interest in real property which limits or restricts development, management or use of such real property for the purpose of preserving or maintaining the scenic, open, natural, or existing character, condition, significance or amenities of the real property.

Dune—A naturally occurring accumulation of sand in wind-formed ridges or mounds landward of the beach, often characterized by the natural growth of beach grass (*Ammophila breviligulata*). This definition shall, however, include man-made deposits of sand placed on or landward of a beach for the purpose of “dune” construction.

Some final thoughts:

It is important to stress that an area that has been overcleared and is required to be revegetated is not to be treated as a garden or even landscaping. It is an area that is to revert back to “nature”. That means no raking in the revegetated area. The leaf litter is of **vital** importance to the ecosystem nourishing the soil and housing countless organisms (from the microscopic to birds and animals) that all play a role in the health of the habitat. The only manipulation of the revegetated area should be some invasive removal to keep the non native weeds down while the native plants get established. After the native plants are established they should be allowed to grow and spread naturally. While uncleared areas and revegetated areas may not look as organized and neat as you would like, it is very important to realize they are not “gardens” or part of your landscaping “envelope.” Let nature take its course. There is great beauty to the “natural” look if you realize (or take the perspective) that a natural area is a complex, intricate web of life and not just a mess of leaves under the trees.

We also want to encourage you to plant native plants even in your landscaped area. Every little bit helps. And you can arrange and trim the natives to your liking and manage it as a garden. The cumulative effect of many native plantings in a residential neighborhood together with the protection of the remaining native communities can provide a real environmental benefit.

Quick Reference Table for Maximum Clearing Allowed

	LOT AREA	MAX CLEARING PERMITTED
WROD- Water Recharge Overlay District	Up to and including 39,999	10,000 or 35% of lot area
	From 40,000 to and including 280,000	10,000+ (lot area x 12.5%)
	Greater than 280,000	45,000
HPOD- Harbor Protection Overlay District	Up to and including 39,999	10,000 or 35% of lot area
	From 40,000 to and including 280,000	10,000+ (lot area x 12.5%)
	Greater than 280,000	45,000
255-2-20- Residential District Provisions	Up to and including 10,999	100%
	From 11,000 to and including 19,999	10,999 or 75%
	From 20,000 to and including 280,000	10,000 + (lot area x 25%)
	Greater than 280,000	80,000

PLANT SPACING TABLE

Number of plants needed for an area based on spacing

		Planting area (sqft)							
		500	1,000	2,000	3,000	4,000	5,000	10,000	20,000
Spacing (ft)	1	500	1,000	2,000	3,000	4,000	5,000	10,000	20,000
	1.5	222	444	888	1,333	1,777	2,222	4,444	8,888
	2	125	250	500	750	1,000	1,250	2,500	5,000
	3	55	111	222	333	444	555	1,111	2,222
	4	31	62	125	187	250	312	625	1,250
	5	20	40	80	120	160	200	400	800
	6	13	27	55	83	111	138	277	555
	8	7	15	31	46	62	78	156	312
	9	6	12	24	37	49	61	123	246
	10	5	10	20	30	40	50	100	200
	12	3	6	13	20	27	34	69	138

Plant Type	Size	Planting distance- on center
trees	8-10ft	10 ft
shrubs	3-4 ft	5 ft
ground cover	1 gallon	3 ft

Local Native Plant Landscapers, Arborists, Native Plant Growers and Suppliers

This list is NOT comprehensive and its intent is to provide a reference to the businesses that are involved in some respect with native plants. If you are interested or know of anyone interested in being included on the list please contact Natural Resources Department. We will be happy to put any business interested in native plants and working with them on the list.

COMMON EXOTIC AND INVASIVE PLANTS

FORBS

Alfalfa	<i>Medicago sativa</i>
Alsike Clover	<i>Trifolium hybridum</i>
Annual Wormwood	<i>Aretemisia annua</i>
Asiatic Dayflower	<i>Commelina communis</i>
Bachelor's-Button	<i>Centaurea cyanis</i>
BirdFoot Trefoil	<i>Lotus corniculatus</i>
Bird's-Eye Speedwell	<i>Veronica chamaedrys</i>
Black Medick	<i>Medicago lupulina</i>
Black Mustard	<i>Brassica nigra</i>
Bladder Campion	<i>Silene cucubalus</i>
Bouncing Bet	<i>Saponaria officinalis</i>
Broad Dock	<i>Rumex obtusifolius</i>
Buckwheat	<i>Fagopyrum sagittatum</i>
Bugle	<i>Ajuga reptans</i>
Bulbous Buttercup	<i>Ranunculus bulbosus</i>
Bull Thistle	<i>Cirsium vulgare</i>
Butter-and-Eggs	<i>Linaria vulgaris</i>
Canada Thistle	<i>Cirsium arvense</i>
Catnip	<i>Mentha arvensis</i>
Cat's-Ear	<i>Hypochoeris radicata</i>
Celandine	<i>Chelidonium majus</i>
Charlock	<i>Brassica kabera</i>
Cheeses	<i>Malva neglecta</i>
Chickory	<i>Chicorium intybus</i>
Chinese Lespedeza	<i>Lespedeza cuneata</i>
Chinese Mustard	<i>Brassica juncea</i>
Coltsfoot	<i>Tussilago farfara</i>
Common Burdock	<i>Arctium minus</i>
Common Dandelion	<i>Taraxacum officinale</i>
Common Plantain	<i>Plantago media</i>
Common Chickweed	<i>Stellaria media</i>
Common Groundsel	<i>Senecio vulgaris</i>
Common Mullein	<i>Verbascum thapsus</i>
Common Nightshade	<i>Solanum nigrum</i>
Common Plantain	<i>Plantago major</i>
Common Sow-Thistle	<i>Sonchus asper</i>
Common Speedwell	<i>Veronica officinalis</i>
Common St. Johnswort	<i>Hypericum perforatum</i>
Common Tansy	<i>Tanacetum vulgare</i>
Corn-Cockle	<i>Agrostemma githago</i>
Corn Gromwell	<i>Lithospermum arvense</i>
Corn Speedwell	<i>Veronica arvensis</i>
Cow vetch	<i>Vicia cracca</i>
Creeping Buttercup	<i>Ranunculus repens</i>

Creeping Wood-Sorrel	<i>Oxalis corniculata</i>
Curley Dock	<i>Rumex crispus</i>
Cypress Spurge	<i>Euphorbia cyparissias</i>
Dame's Rocket	<i>Hesperis matronalis</i>
Day Lily	<i>Hemerocallis flava</i>
Deptford Pink	<i>Dianthus armeria</i>
Dusty Miller	<i>Artemesia stelleriana</i>
English Plantain	<i>Plantago lanceolata</i>
Erect Bugle	<i>Ajuga genevensis</i>
Evening Lychnis	<i>Lychnis alba</i>
Feverfew	<i>Chrysanthemum parthenium</i>
Field Mustard	<i>Brassica rapa</i>
Field Pennycress	<i>Tlapsis arvense</i>
Field Sow-Thistle	<i>Sonchus arvensis</i>
Field Speedwell	<i>Veronica agrestis</i>
Field Thistle	<i>Cirsium discolor</i>
Flax	<i>Linum usitassimum</i>
Forking Catchfly	<i>Silene dichotoma</i>
Galinsoga	<i>Galinsoga ciliata</i>
Garlic Mustard	<i>Alliaria petiolata</i>
Giant Hogweed	<i>Heracleum mantegazzianum</i>
Gill-over-the-Ground	<i>Glechoma hederacea</i>
Goatsrue	<i>Galega officinalis</i>
Green Amaranth	<i>Amaranthus retroflexus</i>
Green Amaranth	<i>Amaranthus hybridus</i>
Grape Hyacinth	<i>Muscari botryoides</i>
Hairy Hawkweed	<i>Hieracium hirsuta</i>
Hairy Vetch	<i>Vicia villosa</i>
Heal-All	<i>Prunella vulgaris</i>
Heather Ling	<i>Calluna vulgaris</i>
Helleborine	<i>Epipactis helleborine</i>
Hemp-Nettle	<i>Galeopsis tetrahit</i>
Henbit	<i>Lamium apetala</i>
Horseradish	<i>Armoracia lapathifolia</i>
Hoary Alyssum	<i>Berteroia incana</i>
Hop Clover	<i>Trifolium agrarium</i>
Hyssop	<i>Hyssopus officinalis</i>
Indian Strawberry	<i>Duchesnea indica</i>
Japanese Knotweed	<i>Polygonum cuspidatum</i>
Jimsonweed	<i>Datura stramonium</i>
Kenilworth-Ivy	<i>Cymvalaria muralis</i>
Knawel	<i>Scleranthus annuus</i>
Lady's-Thumb	<i>Polygonum persicaria</i>
Lamb Succory	<i>Arnoseris minima</i>
Lamb's-Quarters	<i>Chenopodium album</i>
Leafy Spurge	<i>Euphorbia esula</i>
Least Hop Clover	<i>Trifolium dubium</i>
Lesser Celandine	<i>Ranunculus ficaria</i>
Lesser Stitchwort	<i>Stellaria graminea</i>
Mayweed	<i>Anthemis cotula</i>
Meadow Cranesbill	<i>Geranium sanguineum</i>

Mossy Stonecrop	<i>Sedum acre</i>
Moth Mullein	<i>Verbascum blattaria</i>
Motherwort	<i>Leonurus cardiaca</i>
Mouse-Ear Chickweed	<i>Cerastium vulgatum</i>
Mugwort	<i>Aretemisia vulgaris</i>
Musk Thistle	<i>Carduus nutans</i>
Night-Flowering Catchfly	<i>Silene noctiflora</i>
Nightshade	<i>Solanum dulcamara</i>
Nodding Thistle	<i>Carduus nutans</i>
Orange Daylily	<i>Hemerocallis fulva</i>
Ox-Eye Daisy	<i>Chrysanthemum leucanthemum</i>
Pasture Thistle	<i>Cirsium pumilum</i>
Peppermint	<i>Mentha piperita</i>
Pineapple-Weed	<i>Matricaria matricarioides</i>
Plumeless Thistle	<i>Carduus acanthoides</i>
Prostrate Knotweed	<i>Polygonum aviculare</i>
Purple Loosestrife	<i>Lythrum salicaria</i>
Prickly Lettuce	<i>Lactuca scariola</i>
Queen Anne's-Lace	<i>Dauca carota</i>
Rabbit's-Foot Clover	<i>Trifolium arvense</i>
Red Clover	<i>Trifolium pratense</i>
Roadside Peppergrass	<i>Lepidium ruderale</i>
Rough-Fruited Cinquefoil	<i>Potentilla recta</i>
Salsify	<i>Tragopogon porrifolius</i>
Sand Spurrey	<i>Spergularia rubra</i>
Scarlet Lynchnis	<i>Lychnis chalcedonica</i>
Scotch Thistle	<i>Onopordum acanthium</i>
Sea-Poppy	<i>Glaucium flavum</i>
Self-Heal	<i>Prunella vulgaris</i>
Sheep Sorrel	<i>Rumex acetosella</i>
Sheperd's Purse	<i>Capsella bursa-pastoris</i>
Shrubby Lespedeza	<i>Lespedeza bicolor</i>
Sleepy Catchfly	<i>Silene antirrhina</i>
Slender Speedwell	<i>Veronica filiformis</i>
Small-Flowered Cranesbill	<i>Geranium pusillum</i>
Smaller Hop Clover	<i>Trifolium procumbens</i>
Spearmint	<i>Mentha spicata</i>
Spotted Knapweed	<i>Centaurea maculosa</i>
Spotted Medick	<i>Medicago arabica</i>
Stinging Nettle	<i>Urtica dioica</i>
Stinking Groundsel	<i>Senecio viscosus</i>
Storksbill	<i>Erodium cicutarium</i>
Sweet-William Catchfly	<i>Silene armeria</i>
Tansy Ragwort	<i>Senecio jacobaea</i>
Teasel	<i>Dipsacus laciniatus</i>
Thyme-Leaved Speedwell	<i>Veronica serpyllifolia</i>
White Clover	<i>Trifolium repens</i>
White Mustard	<i>Brassica hirta</i>
White Sweet Clover	<i>Melilotus alba</i>
Whitlow-grass	<i>Draba verna</i>
Wild Chamomile	<i>Matricaria chamomilla</i>

Wild Garlic	<i>Allium vulgare</i>
Wild Parsnip	<i>Pastinaca sativa</i>
Wild Radish	<i>Raphanus raphanistrum</i>
Winged Plumeless Thistle	<i>Carduus tenuiflorus</i>
Winter Cress	<i>Barbarea vulgaris</i>
Wood Strawberry	<i>Fragaria vesca</i>
Yarrow	<i>Achillea millefolium</i>
Yellow Goat's-Beard	<i>Tragopogon pratensis</i>
Yellow Iris	<i>Iris pseudacorus</i>
Yellow Sweet Clover	<i>Melilotus officinalis</i>
Yellow Vetchling	<i>Lathyrus pratensis</i>

GRASS/GRASSLIKE

Amur Silver-Grass	<i>Miscanthus sacchariflorus</i>
Arundo	<i>Arundo donax</i>
Bamboo	<i>Pseudosasa japonica</i>
Barnyard Grass	<i>Echinochloa crusgalli</i>
Barley	<i>Hordeum vulgare</i>
Barren Brome	<i>Bromus sterilis</i>
Beadgrass	<i>Paspalum paspalodes</i>
Bermuda Grass	<i>Cynodon dactylon</i>
Bulbous Bluegrass	<i>Poa bulbosa</i>
Bur Foxtail	<i>Setaria verticillata</i>
Canada Bluegrass	<i>Poa compressa</i>
Cheat	<i>Bromus secalinus</i>
Chinese Silvergrass	<i>Miscanthus sinensis</i>
Crested Wheatgrass	<i>Agropyron cristatum</i>
Ditch Reed	<i>Phragmites australis</i> (Eurasian strain)
Downy Chess	<i>Bromus tectorum</i>
Elegant Hairgrass	<i>Aira elegantissima</i>
Eulalia	<i>Miscanthus sinensis</i>
Feathertop	<i>Calamagrostis epigeios</i>
Foxtail Millet	<i>Setaria italica</i>
Golden Bamboo	<i>Phyllostachys aurea</i>
Gray Hairgrass	<i>Corynepherous canescens</i>
Green Foxtail	<i>Setaria viridis</i>
Hairgrass	<i>Aira praecox</i>
Hairy Chess	<i>Bromus commutatus</i>
Japanese Chess	<i>Bromus japonicus</i>
Johnson-Grass	<i>Sorghum halepense</i>
Kentucky Bluegrass	<i>Poa pratensis</i>
Meadow Fescue	<i>Festuca pratensis</i>
Moorgrass	<i>Molinia caerulea</i>
Nepalese Browntop	<i>Microstegium vimineum</i>
Nodding Foxtail	<i>Setaria faberii</i>
Northern Crab-grass	<i>Digitaria sanguinalis</i>
Oats	<i>Avena sativa</i>
Orchard Grass	<i>Dactylis glomerata</i>
Quackgrass	<i>Elytrigia repens</i>
Quaking Grass	<i>Briza media</i>
Rat's-tail Fescue	<i>Vulpia myuros</i>
Redtop	<i>Agrostis gigantea</i>
Rough Bluegrass	<i>Poa trivialis</i>
Rye	<i>Secale cereale</i>
Ryegrass	<i>Lolium perenne</i>
Sheep Fescue	<i>Festuca ovina</i>
Silver Hairgrass	<i>Aira caryophyllea</i>
Smooth Crab-grass	<i>Digitaria ischaemum</i>
Sorghum	<i>Sorghum bicolor</i>
Speargrass	<i>Poa annua</i>
Stinkgrass	<i>Eragrostis cilianensis</i>
Sweet Vernal Grass	<i>Anthoxanthum odoratum</i>

Tall Fescue	<i>Festuca elatior</i>
Tall Oatgrass	<i>Arrhenatherum elatius</i>
Timothy	<i>Phleum pratense</i>
Velvet Grass	<i>Holcus lanatus</i>
Wheat	<i>Triticum aestivum</i>
Yard Grass	<i>Eleusine indica</i>
Yellow Foxtail	<i>Setaria glauca</i>
Zoysia	<i>Zoysia japonica</i>

SHRUBS

Andromeda	<i>Pieris japonica</i>
Amur Honeysuckle	<i>Lonicera maackii</i>
Asiatic Hydrangea	<i>Hydrangea paniculata</i>
Autumn Olive	<i>Eleagnus umbellata</i>
Basket Willow	<i>Salix purpurea</i>
Black Alder	<i>Alnus glutinosa</i>
Black Locust	<i>Robinia pseudoacacia</i>
Butterflybush	<i>Buddleia Davidae</i>
California Privet	<i>Lisustrum ovalifolium</i>
Chinaberrytree	<i>Melia azedarach</i>
Chinese Privet	<i>Ligustrum sinense</i>
Common Boxwood	<i>Buxus sempervirens</i>
Common Buckthorn	<i>Rhamnus cathartica</i>
Cranberrybush Viburnum	<i>Viburnum trilobum</i>
Daphne	<i>Daphne mezereum</i>
European Barberry	<i>Berberis vulgaris</i>
European Honeysuckle	<i>Lonicera xylosteum</i>
European Privet	<i>Ligustrum vulgare</i>
Forsythia	<i>Forsythia europaea</i>
Forsythia	<i>Forsythia ovata</i>
Heavenly Bamboo	<i>Nandina domestica</i>
Hiba Arborvitae	<i>Thujopsis dolobrata</i>
Hollywood Juniper	<i>Juniperus chinensis var. torulosa</i>
Japanese Barberry	<i>Berberis thunbergii</i>
Japanese Knotweed	<i>Polygonum cuspidatum</i>
Japanese Privet	<i>Ligustrum japonicum</i>
Japanese Spiraea	<i>Spiraea japonica</i>
Japanese Viburnum	<i>Virburnum japonicum</i>
Jetbead	<i>Rhodotypos scandens</i>
Lilac	<i>Syringia vulgaris</i>
Memorial Rose	<i>Rosa wichuraiana</i>
Mimosa	<i>Albizia julibrissin</i> .
Morrow's Honeysuckle	<i>Lonicera morrowii</i>
Multiflora Rose	<i>Rosa multiflora</i>
Norway Maple	<i>Acer platanoides</i>
Old Fashioned Weigela	<i>Weigela florida</i>
Pachysandra	<i>Pachyandra terminalis</i>
Paper Mulberry	<i>Broussonetia papyrifera</i>
Princesstree	<i>Paulownia tomentosa</i>
Rose-of-Sharon	<i>Hibiscus syriacus</i>
Rugose Rose	<i>Rosa rugosa</i>
Russian Olive	<i>Elaeagnus angustifolia</i>
Sawtooth Oak	<i>Quercus acutissima</i>
Scotch Broom	<i>Cytisus scoparius</i>
Siberian Elm	<i>Ulmus pumila</i>
Siebold Vibunum	<i>Viburnum sieboldii</i>
Smooth Buckthorn	<i>Rhamnus frangula</i>
Sweet Breath of Spring	<i>Lonicera fragrantissima</i>
Tartarian Honeysuckle	<i>Lonicera tartarica</i>

Thorny Olive	<i>Elaeagnus pungens</i>
Wayfaring-Tree	<i>Viburnum lantana</i>
Weeping Forsythia	<i>Forsythia suspensa</i>
Whin	<i>Genista tinctoria</i>
White Mulberry	<i>Morus alba</i>
Western Arborvitae	<i>Thuja plicata</i>
Wine Raspberry	<i>Rubus phoenicolasius</i>
Winged Burning Bush	<i>Euonymus alata</i>

TREES

Arborvitae	<i>Thuja orientalis</i>
Austrian Black Pine	<i>Pinus nigra</i>
Balm-of-Gilead	<i>Populus gileadensis</i>
Black Locust	<i>Robinia pseudoacacia</i>
Boxelder	<i>Acer negundo</i>
Bradford Pear	<i>Pyrus calleryana</i>
Catalpa	<i>Catalpa speciosa</i>
Chinaberrytree	<i>Melia azedarach</i>
Crack Willow	<i>Salix fragilis</i>
English Hawthorne	<i>Crataegus monogyna</i>
English Holly	<i>Ilex aquifolium</i>
European Buckthorn	<i>Rhamnus cathartica</i>
European Weeping Birch	<i>Betula pendula</i>
European White Birch	<i>Betula alba</i>
Firs	<i>Abies spp.</i>
Glossy Buckthorn	<i>Rhamnus frangula</i>
Goat (Pussy) Willow	<i>Salix caprea</i>
Honey Locust	<i>Gleditsia tricanthos</i>
Horse Chestnut	<i>Aesculus hippocastanum</i>
Kousa Dogwood	<i>Cornus kousa</i>
Japanese Black Pine	<i>Pinus thunbergiana</i>
Lombardy Poplar	<i>Populus nigra</i>
Mimosa, Silk Tree	<i>Albizia julibrissin</i>
Mock Orange	<i>Philadelphus coronarius</i>
Norway Maple	<i>Acer platanoides</i>
Osage Orange	<i>Maclura pomifera</i>
Plaintree Maple	<i>Acer pseudoplantanus</i>
Paper Mulberry	<i>Broussonetia papyrifera</i>
Plaintree Maple	<i>Acer pseudoplatanus</i>
Pussy Willow	<i>Salix discolor</i>
Princess Tree	<i>Paulownia tomentosa</i>
Russian Olive	<i>Eleagnus angustifolia</i>
Sawtooth Oak	<i>Quercus acutissima</i>
Scotch Pine	<i>Pinus sylvestris</i>
Siberian Crabapple	<i>Pyrus baccata</i>
Siberian Elm	<i>Ulmus pumila</i>
Spruces	<i>Picea spp.</i>
Sweet Cherry	<i>Prunus avium</i>
Tree-of-Heaven	<i>Ailanthus altissima</i>
Weeping Willow	<i>Salix babylonica</i>
Western Arborvitae	<i>Thuja plicata</i>
White Mulberry	<i>Morus alba</i>
White Poplar	<i>Populus alba</i>

VINES

Amur Peppervine	<i>Ampelopsis brevipedunculata</i>
Bigleaf Periwinkle	<i>Vinca major</i>
Bitter Nightshade	<i>Solanum dulcamara</i>
Black Bindweed	<i>Polygonum convolvulus</i>
Black Swallow-Wort	<i>Cynanchum louiscae</i>
Boston Ivy	<i>Parthenocissus tricuspidata</i>
Chinese Matrimony Vine	<i>Lycium chinense</i>
Chinese Wisteria	<i>Wisteria sinensis</i> .
Chinese Yam	<i>Dioscorea oppositifolia</i>
Clematis	<i>Clematis maximowicziana</i>
Climbing Euonymous	<i>Euonymous fortunei</i>
Common Hop	<i>Humulus lupulus</i>
Common Morning-Glory	<i>Ipomoea purpurea</i>
Common Periwinkle	<i>Vinca minor</i>
Crown Vetch	<i>Coronilla varia</i>
English Ivy	<i>Hedera helix</i>
Everlasting Pea	<i>Lathyrus latifolius</i>
European Matrimony Vine	<i>Lycium barbarum</i>
Fiveleaf Akebia	<i>Akebia quinata</i>
Japanese Honeysuckle	<i>Lonicera japonica</i>
Japanese Wisteria	<i>Wisteria floribunda</i>
Kudzu	<i>Pueraria montana</i>
Mile-a-minute Weed	<i>Polygonum perfoliatum</i>
Oriental Bittersweet	<i>Celastrus orbiculata</i>
Oriental Clematis	<i>Clematis orientalis</i>
Porcelain Ampelopsis	<i>Ampelopsis brevipedunculata</i>
Purple Crownvetch	<i>Coronilla varia</i>
Sweet Autumn Clematis	<i>Clematis terniflora</i>
Sweet Pea	<i>Lathyrus odoratus</i>
Trumpet Creeper	<i>Campsis radicans</i>
Winter Creeper	<i>Euonymus fortunei</i>

A Collection of Wildflower Pictures Native to East Hampton Town

All Pictures taken in East Hampton Town

Asters

Calico Aster (*Aster lateriflorus*)

Maryland Golden Asters (*Chrysopsis mariana*)

Flat-topped White Aster (*Aster umbellatus*)

New England Aster (*Aster novae-angliae*)

Heath Aster (*Aster ericoides*)

New York Aster (*Aster novi-belgii*)

Late-flowering Aster (*Aster patens*)

Sickle-leaved Golden Aster (*Chrysopsis falcata*)

Stiff-leaved Aster (*Aster linariifolius*)

Beach Pea (*Lathyrus maritimus*)

White Wood Aster (*Aster divaricatus*)

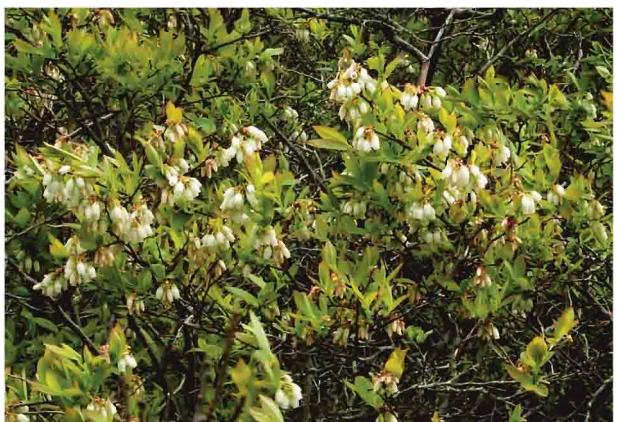

Beach Plum (*Prunus maritima*)

Yellow Thistle (*Cirsium horridulum*)

Bearberry (*Arctostaphylos uva-ursi*)

Black-eyed Susan (*Rudbeckia hirta*)

Canada Burnett (*Sanguisorba canadensis*)

Blue-eyed Grass (*Sisyrinchium angustifolium*)

Canada Frostweed (*Helianthemum canadense*)

Blue Flag Iris (*Iris versicolor*)

Cardinal Flower (*Lobelia cardinalis*)

Round-headed Bush Clover (*Lespedeza capitata*)

Colombine (*Aquilegia canadensis*)

Daisy Fleabane (*Erigeron annus*)

Sandplain Gerardia (*Agalinis acuta*)

Evening Primrose (*Oenothera biennis*)

Goat's-Rue (*Tephrosia virginiana*)

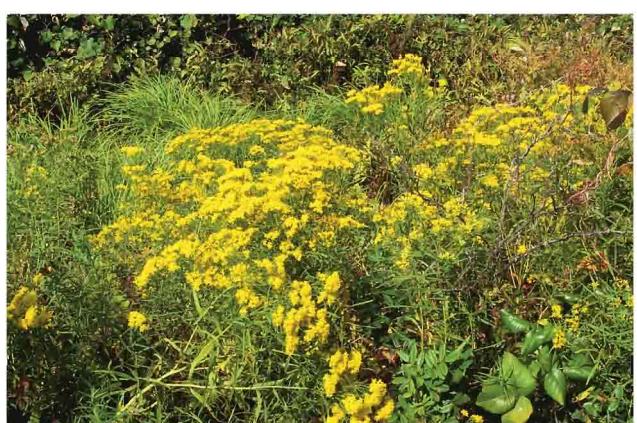

Downy False Foxglove (*Aureolaria virginica*)

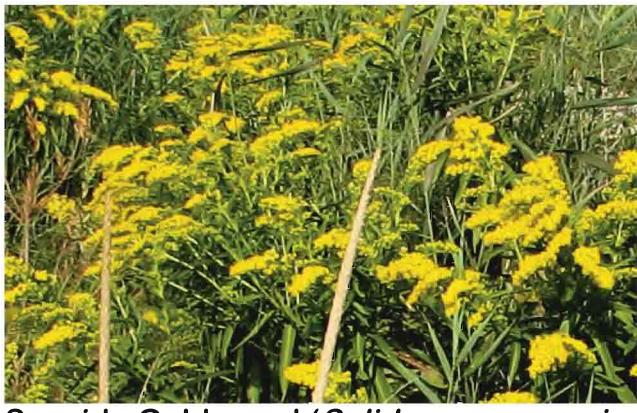

Gray Goldenrod (*Solidago nemoralis*)

Purple Gerardia (*Gerardia purpurea*)

Sweet Goldenrod (*Solidago odora*)

Seaside Goldenrod (*Solidago sempervirens*)

Hyssop-leaved Thoroughwort (*Eupatorium hyssopifolium*)

Groundnut (*Apios americana*)

Indian Pipe (*Monotropa uniflora*)

Beach Heather (*Hudsonia tomentosa*)

False Indigo (*Amorpha fruticosa*)

Golden Heather (*Hudsonia ericoides*)

Inkberry (*Ilex glabra*)

Jack-in-the-pulpit (*Arisaema triphyllum*)

Lyre-leaved Rock Cress (*Arabis lyrata*)

Joe Pyeweed (*Eupatorium dubium*)

Marsh Hibiscus (*Hibiscus palustris*)

Pink Lady's slipper (*Cypripedium acaule*)

Marsh Pink (*Sabatia stellaris*)

Wild Pink (*Silene caroliniana*)

Common Meadow Beauty (*Rhexia virginica*)

Milkweeds

Blunt-leaved Milkweed (*Asclepias amplexicaulis*)

White Milkweed (*Asclepias variegata*)

Butterflyweed (*Asclepias tuberosa*)

Virginia Mountain Mint (*Pycnanthemum virginianum*)

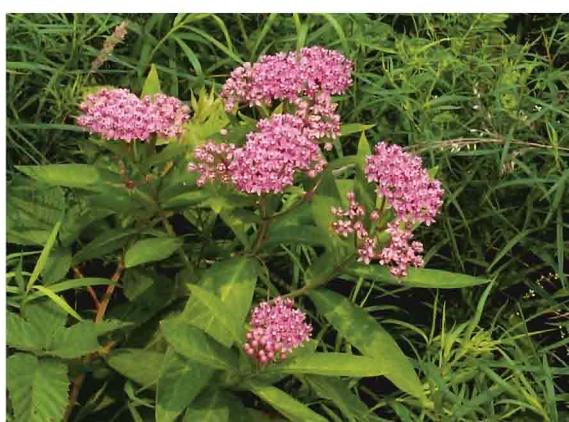

Whorled Milkwort (*Polygala verticillata*)

Common Milkweed (*Asclepias syriaca*)

New England Blazing Star (*Liatris scariosa var.*)

Swamp Milkweed (*Asclepias incarnata*)

Orchids

Calapogon (*Calapogon puchellis*)

Pennsylvania Smartweed (*Polygalum pensylvanicum*)

Crested Yellow Orchis (*Habeneria cristata*)

Pine-Barren Sandwort (*Minuartia caroliniana*)

Nodding Ladies'-tresses (*Spiranthes cernua*)

Prickly-Pear Cactus (*Opuntia humifosa*)

Partridge-Pea (*Cassia fasciculata*)

Plantain-leaved Pussytoes (*Antennaria plantaginifolium*)

Saltmarsh Fleabane (*Pluchea purperescens*)

Seabeach Sandwort (*Aranaria pectinoides*)

Saltwort, Glasswort (*Salicornia* spp.)

Sea Lavendar (*Limonium carolinianum*)

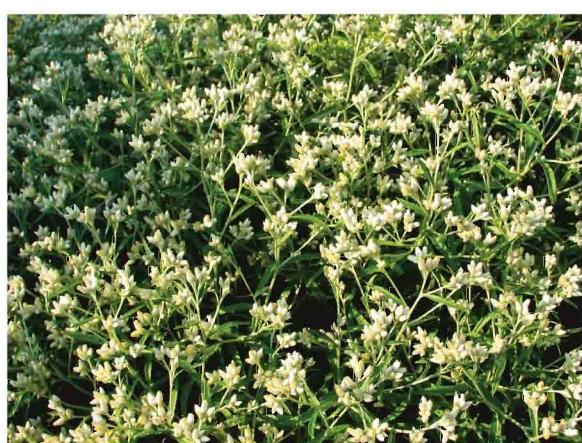

False Solomon's Seal (*Smilacina racemosa*)

Seabeach Amaranth (*Amaranthus pumilus*)

Seabeach Knotweed (*Polygala glaucum*)

Sweet Everlasting (*Gnaphalium obtusifolium*)

Sweet Pepperbush (*Clethra alnifolia*)

Trailing Arbutus (*Epigaea repens*)

Bird's-foot Violet (*Viola pedata*)

Northern Downy Violet (*Viola fimbriatula*)

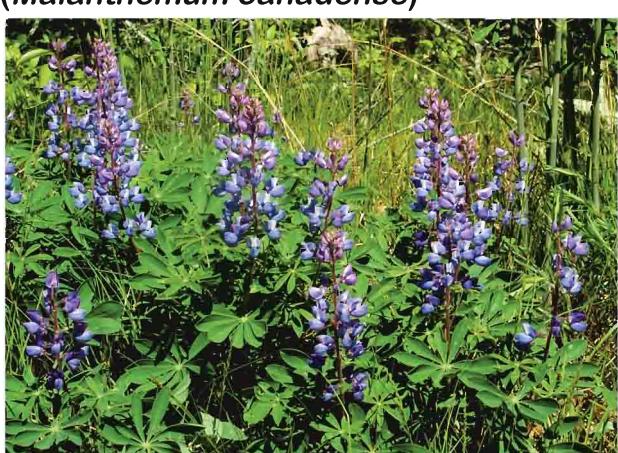

Trailing Wild Bean (*Strophostyles helvola*)

Wild Lily-of-the-Valley, Canada Mayflower (*Maianthemum canadense*)

Turk's-cap Lily (*Lilium superbum*)

Wild Lupine (*Lupinus perennis*)
